Applications

Wedge mount is specifically designed for use where permanent mounting of the vibrator is not possible. The female part is welded to the hopper and the male wedge carries the vibrator. One male and vibrator can be used with many females.

Design

The wedge angle is designed to withstand vibration without jamming and for easy removal of the wedge without tools. The face of the male wedge is directly under the vibrator action for maximum efficiency.

VSS offers the accessories required for the mounting, installation and control of vibrators and interval impactors.

VSS provides provides solutions. Consult our experienced application technicians.
